# CIEE in Monteverde, Costa Rica

| | |
|---|---|
| **Course name:** | Tropical Community Ecology |
| **Course number:** | ECOL 3001 MVCR |
| **Programs offering course:** | Costa Rica: Monteverde - Tropical Ecology and Conservation |
| **Language of instruction:** | English |
| **U.S. Semester Credits:** | 4 semester/6 quarter hours |
| **Contact Hours:** | 60 hours |
| **Term:** | Spring 2019 |
| **Course meeting times:** | Monday and Friday 1PM- 3 PM and scheduled fieldtrips |
| **Course meeting place:** | Classroom, Monteverde Biological Station |
| **Professor:** | Alan R. Masters, PhD |
| **Contact Information:** | office phone 2645-5539, mobile phone 8391-7160, email amasters@ciee.org |
| **Office address:** | CIEE Office, Monteverde Biological Station |
| **Office hours:** | Tuesdays 1-3 pm |

## Course Description

This course explores the variety of tropical communities, how they are organized, how they function and how they are compromised by human activity. Students will build a tropical community from the ground up, both theoretically and through direct experience and experimentation in the field. They will learn to define the Tropics based upon global climate patterns, to know why tropical forests are productive despite poor soils, how plants adapt to live according to their growth form, how energy flows through Tropical communities and what this tell us about their organization and stability, the many ways species interact and how this impacts ecosystem function. Students contrast intact and human-transformed Tropical communities and assess how they are different structurally and understand how this can lead to loss of function. Ecosystem functions that are vital to human wellbeing are explored. Finally, students will extrapolate these issues to conservation and how to lessen human impact on Tropical communities.

## Learning Objectives

Upon completion of the course students will:

- Understand fundamental ecological concepts, particularly those related to Tropical Ecosystems and how the Tropics are different from Temperate and Boreal forests.
- Appreciate the full range of variation in Tropical communities, where this variation comes from and how it impacts structure, function and conservation of these communities.
- Critique models of Tropical Conservation and how likely these are lessen human impact.
- Merge Language, Culture and Ecology to construct a more holistic conservation ethic.
- Tackle the biological complexity of Tropical communities, more fully appreciate their importance and forge a stronger and more effective resolve to save them.

## Course Prerequisites

One year of Introductory Biology and one elective in whole organismic biology or conservation.

## Methods of Instruction

Students will attend lectures and related activities. Lectures will emphasize theory and current empirical patterns. Students will read and analyze current literature. In addition, students will travel and spend extensive time in the field in different ecosystems to understand the impact of climate on their composition, structure and function. Faculty-led, short experiments in groups will emphasize patterns of diversity and species interactions.

## Assessment and Final Grade

| | | |
|---|---|---|
| 1. | Midterm exam | 25% |
| 2. | Final exam | 40% |
| 3. | Laboratory | 30% (2 written field reports, 1 oral presentation) |
| 4. | Participation | 5% |

## Course Requirements

### Exams

Each exam will include True/False, Multiple Choice, Short and Long Answer formats for material covered in lecture or in readings. These will cover objective, factual information.

### Field Reports

Some short experiments will result in field reports, which are written manuscripts in the style of a short note in a scientific journal. These will be no more than three pages in length and will include cited literature, data analysis, presentation and interpretation.

### Oral Presentation

One short experiment will require an oral presentation using PowerPoint. The student will be graded on how well they present and explain the project: justification, study question, methods, results and conclusions.

### Participation

Students are expected to attend all lectures and activities, hand in all assignments, as well as ask questions and participate in discussions. Only students that are active participants will receive full credit. Perfect attendance and handing in all assignments will result in 3 of 5 points.

**Required Text**

Kricher, J. 2011. Tropical Ecology. Princeton University Press. Also assigned readings

**Weekly Schedule**

| | |
|---|---|
| **Weeks 1-2** | **Orientation, Field Trip: Survey of Seasonal Tropical Ecosystems, Why Study Tropical Ecology and Conservation? The Tropical Ecology and Conservation Agenda.** Introduction, Urban Ecology, Paramo, Mangroves, Lowland Wet Forest, Lowland Moist Forest, Lowland Dry Forest, Extinct Megafauna, Current State of Tropical Forests. Experiments – Diversity and Species Interactions.<br><br>Readings: Malhi et al. 2014, Janzen and Martin (1981), Seddon et al. (2014), Corlett (2012). |
| **Week 3** | **Defining Ecological Communities and How Tropical Communities Differ** Hierarchy of biological organization, community assembly rules, stochastic vs. deterministic effects, empirical patterns, Tropical forests vs. temperate forests. Short term experiments with statistics.<br><br>Readings: Gillespie (2004), Fayle et al. (2015). |
| **Week 4** | **Global Climate: Impact in Defining the Tropics and Tropical Community Types** The impact of Earth's relationship with the sun on global rainfall and seasonality, windward/leeward effects, Costa Rican and Monteverde weather, el Niño and global warming effects, Holdridge Life Zone Classification System.<br><br>Readings: Corlett (2014), Brodie et al (2012), Olson et al. (2001). |
| **Week 5** | **The Paradox of Tropical Luxuriance** The causes and consequences of Tropical soil composition and fertility, plant responses and sustained high productivity, mycorrhizae, likelihood of sustainable agriculture in the tropics.<br><br>Readings: Townsend (2008), Mann (2002), Nadeau and Sullivan (2015). |
| **Week 6** | **Movement of Matter and Energy through Tropical Communities** How energy moves, how much is captured, trophic relationships, food webs, that matter is finite and is recycled, |

| | |
|---|---|
| | major biogeochemical cycles, how cycles are disrupted by humans.<br><br>Readings: Laurance, et al. (1997)**,** Bello et al. (2015), Poorter et al. 2016. |
| **Weeks 7** | **Plant Growth Forms** Identifying and defining growth form: understory, subcanopy, canopy, lianas, vines, epiphytes, hemi-epiphytes, epiphylls. Abiotic differences experienced by different growth forms, morphological and physiological adaptations<br><br>Readings: Rundel and Gibson (1996), Valladares, et al. (2002), Collins et al. (2015).<br><br>**MIDTERM** |
| **Weeks 8-9** | **SECOND FIELD TRIP** |
| **Week 10** | **Gap Dynamics and Natural Succession in Tropical Forests** How a gap forms, gap size distribution and frequency, succession in gaps, who wins a gap, the random walk to extinction.<br><br>Readings: Brokaw and Busing (2000), Chazdon. (2008), Hunter et al. (2015). |
| **Week 11** | **Introduction to Species Interactions** Mutualism, Commensalism, Parasitism, Predation, Neutralism, Ammensalism, Competition<br><br>Readings: Janzen (1983), Schoener et al. (2005), Bregman et al. (2015)<br><br>**Herbivory and Plant Defenses in Tropical Forest** Defining and quantifying herbivory, how the tropics differ from temperate forests in amount and type of herbivory, physical and chemical plant defenses and their impact on herbivores, mimicry and coevolution.<br><br>Readings: Hunt (2003), Fine et al. (2004), Salazar and Marquis (2012), Leal et al. (2014). |
| **Week 12** | **Pollination and Seed Dispersal** Payoffs of both partners, optimal outcrossing distances, morphological, physiological and behavioral changes, density-dependent mortality, impact on gene pool and distribution, disruption by humans and associated problems. |

Readings: Mawdsley, et al. (2008), Wang and Smith (2002), Bettset al. (2015), Bruna (1999), Hamilton (1999).

**Seasonality** Patterns related to seasonality in flowering and fruiting, underlying reasons and consequences to mutualistic partners.

Readings: Sakai (2001).

**Week 13**

**Disturbance, Biodiversity and Community Stability** How high biodiversity in Tropical communities impacts its stability, including resistance to invasion, resistance, resilience, robustness, redundancy, Portfolio Effects, increase in function with biodiversity, loss of biodiversity and its impact on stability.

Readings: Zavaleta et al. (2009), Lewis (2009) and Basic and Blummenthal. (2005).

**Week 14**

**The Future of Tropical Forests and How to Save Them** Personal behavior vs. government policy, regeneration and restoration, the importance of reserves, the place humans have in an intact ecosystem, the future, where to go with the knowledge gained on the program, how to make difference.

Readings**:** Wright (2005), Laurence. (2005), Tabarelli et al. (2012), du Toit, et al. (2004), Wilson. (2000) and Orr (2004).

**FINAL EXAM**
